

IMPORTANT

The sample data files provided for STAGEN have all been updated to work with version STAGEN-17.2. That means they will not work with STAGEN-17.1. The only difference is that in 17.2 the gas constant, RGAS, and specific heat ratio, GAMMA, are input as the first line of data. In STAGEN-17.1 they are set by default to the values for air.

The compiled version of STAGEN provided for LINUX and for WINDOWS are both STAGEN-17.1. To run them with the sample data sets you will need to remove the first line of data and set the required values of RGAS and GAMMA by changing the defaults and recompiling the program.
