

CONVERT.F

This program will convert data sets for older versions of MULTALL to the **new_readin** format used in MULTALL-OPEN. It accepts MULTALL-14 and MULTALL-15 data sets and with minor changes should be able to accept earlier data sets.

The program **convert** needs to be compiled with the common block **commall-open-17.1** in the same directory. The file to be converted must be named **stage_old.dat** and must also be in the same directory.

If the executable code is **convert.x** simply type **convert.x** to run it. A lot of data, which is not used but will help in finding any errors, will appear on the screen and will end with a message saying "CONVERSION COMPLETED". The runtime is less than a second. The converted file named **new_readin.dat** will appear in the same directory. This should be able to run on **multall_open** using intype "N" without making any changes to it.
